

Honeywell FRAM announces a new and improved oil filter for Detroit Diesel Series 60 engines:

June, 2000

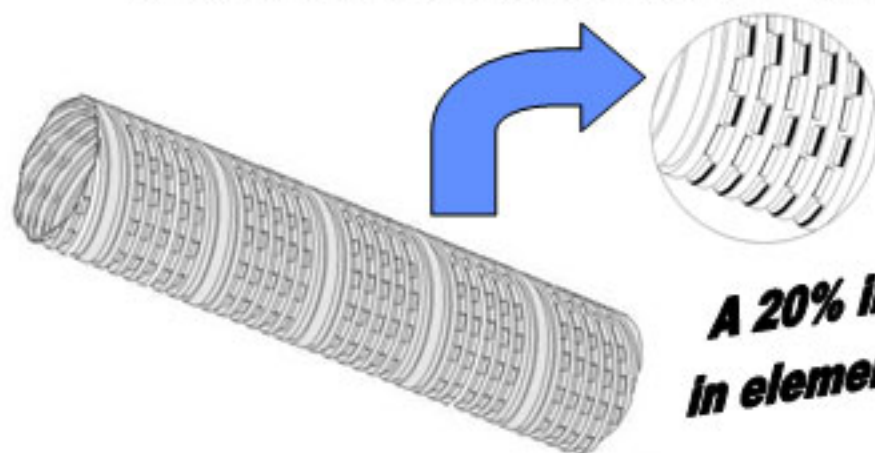

Effective 7/10/00 we have superseded the FRAM PH7405 to the FRAM PH7405A

In conjunction with Detroit Diesel, our engineers and designers have implemented several improvements to our PH7405 (1993 and newer DDC Series 60 oil filter):

Exclusive new media designed for exceptional capacity, strength with no loss in efficiency

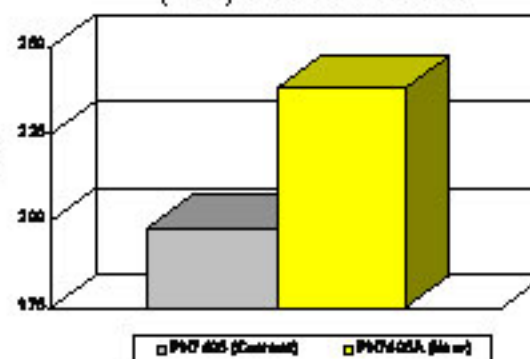

A louvered center tube that insures the highest internal strength while maximizing flow. High flow rates insure even and consistent dirt loading

A 20% improvement in element strength!

Centertube Collapse Strength (PSI) Per SAE J806

The FRAM PH7405A is the first in new generation filtration to protect your engine from the increased soot levels generated by new higher emissions requirements.
